We Prune Trees Year Round...

Professional pruning is the best way to prepare your trees for the onslaught of winter. Tree branches are subject to winter winds and ice and snow build-up. Tree crowns form virtual walls that wind can barely penetrate, causing weak limbs to break. Ice and snow add a tremendous amount of weight to limbs, which can also cause them to break, especially if we have an early-season storm before the leaves drop. Professional pruning prepares your trees to stand up to winter and survive.

Healthy Trees Need Healthy Soil

When a tree looks sick, our Plant Health Care professionals look down as well as up to make their diagnosis. Soil plays a significant role in tree health. If soil is lacking nutrients, beneficial fungi and bacteria, it can't nourish the tree and the tree's health is jeopardized. In many cases, our prescription is deep root fertilization, and the best time for deep root fertilization is in the fall.

Leaf loss early in the fall is one way to tell that a tree is planted in unhealthy soil. The early leaf drop will also reduce the amount of energy that the tree can produce through photosynthesis. This will contribute to a tree's failing health, and unhealthy trees are vulnerable to insects and diseases.

When we perform deep root fertilization, we inject liquid fertilizer directly into the soil around the roots so the essential nutrients are available to the tree right away. If the soil needs an infusion of beneficial bacteria and fungi, we include them in the fertilizer formulation.
